SUMMARY

8+ years of experience as a Senior Systems Engineer, with a recent focus on DevSecOps and platform security. Experience includes building and securing cloud-native infrastructure, developing eBPF-driven observability, and implementing GitOps automation for multi-region AWS EKS. Led container image signing and security enforcement at Qualtrics and developed klew.dev, an open-source investigation tool for on-call engineers.

EXPERIENCE

Qualtrics LLC – Senior Systems Engineer – Reston, Virginia
Oct 2021 – Present

- Run the multi-region AWS EKS and Nomad clusters that host Qualtrics' customer-facing applications.
- Keep those applications within SLA through production monitoring, 24/7 on-call support, and incident response.
- Managed multi-region AWS EKS and Nomad clusters, using Cilium network policies and OPA/Kyverno policy enforcement to meet SLAs.
- Rolled out Istio mTLS for service-to-service traffic, with minimal application changes.
- Set up eBPF-based observability with Cilium and Hubble, making network troubleshooting faster with flow-level visibility and no sidecars.
- Built ArgoCD GitOps workflows for versioned, auditable, and automated deployments.
- Automated environment provisioning with Terraform, Ansible, Python, and AWS CDK, cutting setup time and preventing manual drift.
- Handled production monitoring and incident response using Prometheus, Grafana, and Elastic Stack. Improved MTTR with automated runbooks and smarter alerts.
- Helped integrate LLM and ML workflows (LangChain) into internal tools and microservices to lighten operational load.
- Implemented container supply-chain security by adding image signing, publishing, and Wiz scanning to CI/CD pipelines, and enforcing Kyverno admission policies at deployment so only compliant images reach production.

Clarabridge – Cloud Engineer – Reston, Virginia
Feb 2021 – Sep 2021

- Provisioned production infrastructure as code with Terraform and CloudFormation across AWS, GCP, and IBM Cloud.
- Managed server configuration, patching, and upgrades with Ansible to keep production environments consistent and up to date.
- Managed centralized Jenkins and its agents for CI/CD pipelines that automated infrastructure provisioning, patching, and upgrades.
- Managed AWS Kubernetes deployments for multi-region availability and SLA compliance.
- Developed AWS Lambda automation to streamline operational tasks and accelerate deployments.
- Collaborated with security teams to strengthen cloud infrastructure by implementing AWS GuardDuty, VPC flow log analysis, and IAM least-privilege policies.

Neustar – Senior Systems Engineer – Sterling, Virginia
Mar 2018 – Feb 2021

- Supported customer-facing CNAM (caller name) services, keeping applications available for millions of end users across public cloud and global data centers.

- Moved configuration management from Chef to Ansible by converting Chef recipes into Ansible roles, making them easier to maintain and improving secrets handling.
- Automated provisioning with Terraform and built Jenkins CI/CD pipelines that deploy in a single step and lower release risk.
- Migrated on-premises infrastructure to AWS and worked on high-volume data streams into ELK and Amazon Kinesis for logging and alerting.
- Designed Jenkins CI/CD pipelines integrating Terraform and CloudFormation, enabling single-step deployments and reducing release rollback rate.

Epic Systems – DevOps Engineer – Herndon, Virginia
Aug 2017 – Feb 2018

- Designed application environments and release management procedures, and provided production support.
- Wrote Ansible playbooks to provision development servers.
- Automated AWS infrastructure (EC2, IAM, VPC, EBS, CloudWatch, CloudTrail, Auto Scaling, S3) with Terraform and integrated Terraform with Jenkins to run pipeline jobs automatically.

GNR Systems Inc. – Software Engineer – Bloomington, Illinois
Apr 2017 – Aug 2017

- Automated build, continuous integration, and continuous deployment pipelines with Git and Jenkins.
- Implemented patch installation and deployments to production and customer environments with Ansible.
- Configured RHEL and UNIX servers, including a data storage server, and wrote UNIX scripts to automate web tasks with Apache.

SKILLS

Cloud Security: Container security, image signing/scanning, admission controllers, Istio (mTLS), Vault, IAM

Kubernetes: AWS EKS, Docker, Helm, ArgoCD (GitOps), client-go, OPA, Kyverno, Nomad

Networking and Observability: eBPF tracing, Cilium, Hubble, Prometheus, Grafana, Elastic Stack (ELK), Splunk, CloudWatch

Infrastructure: Terraform, AWS CDK, CloudFormation, Jenkins, GitLab CI, Ansible, Spinnaker

Cloud: AWS, EKS, EC2, IAM, VPC, Lambda, GuardDuty, GCP, IBM Cloud

Programming and Data: Go, Python, Bash, HCL, React, PostgreSQL, DynamoDB, Firestore

EDUCATION

Master of Science in Computer Engineering, University of Houston–Clear Lake, 2016

PROJECTS

klew.dev: Kubernetes Incident Investigation Desktop App | Wails v2, Go, React, Vite, client-go | klew.dev | GitHub

- Built an open-source (Apache 2.0) macOS desktop app that brings Kubernetes workloads, events, logs, and resource state into one workspace for on-call troubleshooting.
- Connects to local/remote clusters through kubeconfig and the Kubernetes API (client-go); all data stays local, with no SaaS backend.
- Added live cluster watches and periodic snapshots, then used Drain3 to group similar log and event lines so related failures show up together.
- Built the investigation engine: it watches the cluster live, takes snapshots, and uses Drain3 to cluster repeated log patterns into a view of what failed and what else it affected.
